GTGGGAGAGCAATGGGCAGCCG 2058 On Mar 2, 2000 this sequence version replaced gi:32759.

[2] also reports sequences for gamma-3, gamma-4, and a gamma-pseudogene. Most of this sequence is 95* homologous with gamma-4. The hinge exons are only 70* homologous. The authors estimate that gamma-2 and gamma-4 and service of 6 million years ago. The authors in important role in tron-mediated domain transfer played an important role in the evolution of human gamma genes. They also report the hinge regions of gamma-1, gamma-4, and a pseudo-gamma gene. [1] estimates the divergence of the human gamma genes to be between 7.7 and 4.4 million years ago. This entry is part of a multigene region containing the gamma-2, gamma-4, epsilon-1, and alpha-2 genes. The relative locations of the four genes were determined by Flanagan and Rabbitts (Nature 300, 709-713 CCGACGGCTCCTTCTTCCTCTAC 2118 GGAACGTCTTCTCATGCTCCGTG 2178 GCCTCTCCCTGTCCCCGGGTAAA 2238 linear PRI 11-APR-2001 3: gamma-2 constant region, 11 to 1524) 0,T., Nakai,S. and Honjo,T. genes: implications for in human immunoglobulin of the gamma 2 and gamma 4 Vertebrata; Euteleostomi; ; Hominidae; Homo. an immunoglobulin gamma 84-1988 (1982)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the insert of the vector pWDR1002. Three fragments were used in the construction of pWDR1002, a 443 bp Not! I fragment were used in the construction of pWDR1002, a 443 bp Not! I linearised pSAB112 (see AAQ30906). These fragments were ligated together and the ligation (see AAQ30909). These fragments were ligated together and the ligation resistance. The insert encodes the immunoglobulin signal sequence, amino acids (AA) 1-122 of the humanised SAB heavy chain, is: the constant region (HV) and AA114-AA478 of the human 1gG4 heavy chain, is: the constant region (HC). The polypeptide encoded by this sequence is an antibody homolog which was shown to bind to CD4 but did not block the binding of gpl20 to CD4. CD4 is a cell surface glycoprotein of induced syncytia formation. This homolog can be used in the constant prophylaxis and treatment of diseases caused by infective constant whose primary targets are CD4+ cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7;

The inventors designed a molecule including several such sites for attachment of sialy1-Lex side chains (see AAR2442, FT). The additional N-linked glycosylation sites are introduced at locations which impair complement fixing and Fc receptor binding ability. They are preferably located in the CH2 region of the Ig molecule. Antibodies bearing multiple sialy1-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury.
